## **Cheatsheet: Web App Deployment using Flask**

Estimated time needed: 5 minutes

Package/Method	Description	Code Example
Flask	Used to instantiate an object of the Flask class named app.	from flask import Flask
		app = Flask(name)
@app.route decorator	A decorator in Flask used to map URLs to specific functions in a Flask application.	@app.route('/')
		<pre>def hello_world():</pre>
		return " <b>My first Flask application in action!</b> "
200 OK status	Flask servers automatically return a 200 OK status when you return from the @app.route method. 200 is also returned by default when you use the jsonify() method to respond to a request. A successful response with a status code of 200 will be sent back when the given code executes.	@app.route('/')
		<pre>def hello_world():</pre>
		return (" <b>My first Flask application in action!", 200)</b>
Error 404		<pre>@app.route('/')</pre>
		<pre>def search_response():</pre>
		query = request.args.get("q")
	<ul> <li>400 indicates an invalid request. This status could imply the parameters are missing or improper or the request is invalid in another way.</li> <li>401 indicates the credentials are missing or invalid.</li> <li>403 implies that the client credentials are not sufficient to fulfill the request.</li> <li>404 If the server is unable to find the resource, it returns a 404 status.</li> </ul>	if not query:
		return {"error_message": "Input parameter missing"}, 422
		# fetch the resource from the database
		resource = fetch_from_database(query)
	405 indicates that the requested operation is not supported.	if resource:
		return {"message": resource}
		else:
		return {"error_message": "Resource not found"}, 404
Error 500	500 is used when there is an error on the server.	@ app.errorhandler(500)
		def server_error(error):
		return {"message": "Something went wrong on the server"}, 500
